Abstracts

Light field imaging and display is an emerging technology in computational. The light field is a vector function that describes the amount of light flowing in every direction through every point in space. The space of all possible light rays is given by the five-dimensional preoptic function, and the magnitude of each ray is given by the radiance. Michael Faraday was the first to propose (in an 1846 lecture entitled 'Thoughts on Ray Vibrations') that light should be interpreted as a field, much like the magnetic fields on which he had been working for several years.
