Sandstone, also known as sandstone, sandstone by the mineral silica particles formed by crystallization. Sandstone silicalite is made of a mixture of calcium carbonate and iron oxide to form a durable and strong sandstone. In some areas, the hardness of sandstone is even higher than that of granite. Due to its coarse sand grain expansion, especially strong rate of hard, suitable for large outdoor stone works. Limestone is composed of magnesium limestone and calcium carbonate. As opposed to sandstone, it is one of the preferred stone materials for sculptors because of its fine, pure white texture and high processing adaptability. Many types of limestone contain fossil shells and the bones of sea creatures; such stones are either lightly worked or aesthetically pleasing in their own right. The limestone origin is extensive, the color texture is quite rich, its quality is soft, easy to make small-scale carved on the shelf, more suitable for beginners to choose.
