Abstracts

Liposomes and lipid nanoparticles (LNPs) are similar by design, but slightly different in composition and function. Both are lipid nanoformulations and excellent drug delivery vehicles, transporting cargo of interest within a protective, outer layer of lipids. In application, however, LNPs can take a variety of forms. Innovators in the biopharmaceutical industry have developed a number of ways to improve/augment physiochemical properties and ultimately, the drug-like behavior of pharmacological substances. Amidst other alternatives, lipid nanoparticles and liposomes are the main type. Nanoparticle Drug Delivery Systems are engineered technologies that use nanoparticles for the targeted delivery and controlled release of therapeutic agents. The modern form of a drug delivery system should minimize side effects and reduce both dosage and dosage frequency. Recently, nanoparticles have aroused attention due to their potential application for effective drug delivery. Liposomes and Lipid Nanoparticles are delivery carriers, the primary lipids used to make liposomes or Lipid Nanoparticles are Phospholipids, Pegylated Lipids, Ionizable Lipids (Cationic / Anionic Lipids), Triglycerides, Sphingolipids, Neutral Lipids, etc. In our report, we mainly study the Liposomes and Lipid Nanoparticles (LNP) Contract Manufacturing as delivery carriers.
