## Abstracts

Lithium–silicon electrodes are a lithium-ion battery technology that employ a silicon anode and lithium ions as the charge carriers. Silicon has a much larger energy density (25 times as many lithium ions) than graphite. Silicon's large volume change when lithium is inserted is the main obstacle to commercializing this device. Commercial battery anodes may have small amounts of silicon, boosting their performance slightly. The amounts are closely held trade secrets, limited as of 2018 to at most 10% of the anode.
