## Abstracts

Compressor is mainly used for pressurization and gas transportation in natural gas liquefaction unit. For step-by-step liquefaction unit, there are refrigeration compressors with different temperature zones, which are one of the key equipment in the natural gas liquefaction process. The compressor used in natural gas liquefaction mainly has reciprocating type. Centrifugal and axial flow compressors. The compressor used in the natural gas liquefaction unit should take full account of the compressed gas is flammable and explosive dangerous medium. The shaft seal of the compressor is required to have good air tightness, and the electrical facilities and driving motors are equipped with explosion-proof devices. For deep low temperature refrigeration compressor, should also fully consider the impact of low temperature on the compressor component material, because many materials will lose toughness at low temperature, cold brittle damage. In addition, if the compressor inlet temperature is very low, the lubricating oil will freeze and cannot work normally, at this time should choose the compressor without oil lubrication.
