Abstracts

In the natural gas liquefaction plant, different heat exchangers are used in both the liquefaction process and the liquid-gas conversion process. In the process flow, commonly used around the tube and plate - fin heat exchanger. Most basic load - type liquefaction plants use tube - wound heat exchangers. Plate-fin heat exchangers are mainly used in peak-modulated LNG units, but they are also used in basic load LNG units. These two kinds of heat exchangers have been successfully used in low temperature liquefaction and air separation plants. The tubular heat exchanger is characterized by high efficiency and convenient maintenance. If there are individual pipe leaks, the equipment can still be used at the tube plate, and it is very suitable for working conditions with high pressure. The plate-fin heat exchanger has the advantages of low cost, compact structure and widespread application.
