Abstracts

The low-voltage composite switch is a product used for switching capacitors in the low-voltage reactive power compensation device. Its basic working principle is to connect the thyristor and the magnetic latching relay in parallel, controlled by the internal single-chip microcomputer, at the moment of switching on and off, the thyristor undertakes the zero-crossing switching, and then the magnetic latching relay switches on and runs. The composite switch not only has the advantages of zero-crossing switching without inrush current, but also has the characteristics of low operating power consumption of the AC contactor.
