Lubricating oil analysis is primarily a quality control process. It is important to verify the levels of additives and contaminants during the production phase, and equally as important for lubricant users to confirm specifications. New lubricants are primarily tested during manufacturing by the supplier to ensure the oil meets their own specifications for viscosity, cleanliness and additives. New lubricants are also tested by the customer upon delivery and before deployment in their equipment to make sure they are using the right oil and that it is clean and dry.
