The energy industry is a highly critical and depends on the continuous production of products. Any failure in its production can severely affect the customers' businesses. Most of customers included are either large manufacturing industries, government organizations, or utilities. Hence, processes and technologies used in the energy industry need to be highly reliable. Several energy industries utilize fluids and rotating carrying equipment such as lubrication systems, hydraulic systems, gear oil systems, and other process systems. These systems have critical modules or machine parts that need to be handled with care to prevent malfunctions or breakdowns. A significant amount of resources and capital is invested to check and maintain the rotating components as every shut down leads to production losses, thus effecting the company's revenues. Therefore, efficient analysis of lubrication oil is needed for efficient production and avoid any operational failures due to the malfunctioning and wear and tear moving parts.
