Abstracts

The eighth most abundant element in nature, magnesium constitutes 2.4 percent of Earth's crust. Because of its strong reactivity, it does not occur in the native state, but rather it is found in a wide variety of compounds in seawater, brines, and rocks. Among the ore minerals, the most common are the carbonates dolomite (a compound of magnesium and calcium carbonates, $\text{MgCO}_3 \cdot \text{CaCO}_3$) and magnesite (magnesium carbonate, MgCO_3). Less common is the hydroxide mineral brucite, $\text{Mg}(\text{OH})_2$, and the halide mineral carnallite (a compound of magnesium and potassium chlorides and water, $\text{MgCl}_2 \cdot \text{KCl} \cdot 6\text{H}_2\text{O}$). This report mainly covers magnesite and brucite. It has a silvery-white colour and tarnishes slightly in air.
