Abstracts

MRI contrast agents are paramagnetic substances, such as metal ions such as iron, thorium, manganese, etc., whose atoms have several unpaired electrons, have a long relaxation time, have a large magnetic moment, and are oriented in a uniform magnetic field Consistent with the direction of the magnetic field, it is equivalent to increasing the effect of the static field strength, so that when the excited protons or energy is transferred from the protons to the surrounding environment, the relaxation time is shortened. Simply put, it is a potion used to identify benign and malignant objects on the body.
