Abstracts

The magnetostrictive displacement sensor is based on the Weidmann effect between the magnetostrictive waveguide wire and the vernier magnetic ring, which is the core detection element of the sensor, and accurately detects the absolute position of the movable magnetic ring through the internal non-contact measurement and control technology to measure the actual position of the detected product. displacement value. Since there is no direct contact between the active magnetic ring and the sensitive element, which determine the position, the sensor can be used in extremely harsh industrial environments and is not easily affected by oil stains, solutions, dust or other contamination. In addition, the sensor uses high-tech materials and advanced electronic processing technology, so it can be used in high temperature, high pressure and high vibration environment.
