## Abstracts

A mass flow sensor is a sensor for determining a mass flow rate of air entering a fuel-injected internal combustion engine. Air quality information is necessary for the engine control unit to balance and deliver the correct fuel quality to the engine. Air changes with temperature and pressure. In automotive applications, air density varies with ambient temperature, altitude, and use of forced air intake, which means that mass flow sensors are more suitable than volume flow sensors to determine the amount of air intake in each cylinder
