Abstracts

Mediastinoscopy is a procedure used to examine the mediastinum or the space behind the breast bone, between the two lungs. Video Mediastinoscope is a device that is similar to a thoracoscope and can be attached to a camera for live Video during the procedure. The Video Mediastinoscope is used to diagnose a number of cancers around the mediastinum including lung cancer and lymphoma. A number of studies suggest that the diagnostic yield of Video Mediastinoscope is comparable to that of thoracoscope.
