Abstracts

Medical 3D bioprinting is the use of 3D printing-like techniques to combine cells, growth factors or biological materials to create biomedical parts, often with the aim of mimicking natural tissue characteristics. In general, 3D bioprinting can utilize a layer-by-layer approach to deposit materials called bioinks to create tissue-like structures that are subsequently used in various fields of medicine and tissue engineering. Bioprinting covers a wide range of bioprinting techniques and biomaterials. Currently, bioprinting can be used to print tissue and organ models to aid in the study of drugs and potential treatments.
