Abstracts

Melt Flow Testers are used to measure the melt mass-flow rate (MFR), melt volume-flow rate (MVR), as well as Melt density of a wide range of thermoplastic raw materials, polycarbonate, fluoroplastics, as well as polyethylene, polypropylene, ABS, POM etc. A method that is particularly useful in quality control and goods inwards testing, melt flow tests begin by heating the previously weighed out material within the extrusion barrel, which converts the material into granules. A piston, along with a piston transducer, is placed into the extrusion barrel, and the test begins when the test weight puts pressure to the piston, forcing movement of the granules out of the instrument. The melt mass-flow rate (MVR) can then be achieved by measuring the distance that the piston travels per unit of time.
