Abstracts

Membrane separation is the process of selective separation of different components from mixtures, wherein the separated component can be the desired product or a waste product. The materials used for the formulation/manufacture of the membrane are the key to the separation process and include various polymers, ceramics, and metals. These materials are used to make flat sheets and hollow fiber membranes for various membrane filtration systems including microfiltration, ultrafiltration, nanofiltration, and reverse osmosis. Membrane separation is widely used for the treatment of wastewater and for purifying water for drinking and industrial purposes.
