Abstracts

The memory interface chip is the core logic device of the server memory module (also known as ' Random Access Memory '). As the only way for the server CPU to access memory data, its main function is to improve the speed and stability of memory data access and meet the requirements of the server CPU. The ever-increasing high-performance and large-cSouth Koreaity demands of memory modules. The memory interface chip needs to be matched with various memory particles and memory modules produced by memory manufacturers, and must pass the comprehensive and strict requirements of server CPU, memory and OEM manufacturers for their functions and performance (such as stability, running speed and power consumption, etc.). Only after certification can we enter the stage of large-scale commercial use.
