Abstracts

The mesophase of asphalt is a mixture of a variety of flat, disk-shaped, thick pahs with a relative molecular weight of 370 ~ 2000. General substances present optical anisotropy if they exist in crystal state, and optical isotropy if they exist in liquid state. However, in the intermediate stage of the transition from crystal to liquid (or the inverse process), a class of substances present an optically anisotropic turbidity fluid state, which is both liquid form and optically anisotropic. In crystallography, it is called liquid crystal; in physiography, it is called mesophase.
