## Abstracts

Metabolism is a physical process and chemical reaction that includes maintenance of the living state, such as elimination of wastes, blood circulation, functioning of brain, contraction of muscles, controlling body temperature, breathing, and digestion of nutrients and food. It begins with a sequence of chemical reactions and ends with a product. It includes various enzymes and molecules for the completion of the entire process. Enzymes play an important role in this process as these enable the organism to accelerate reactions for gaining the required energy. It is mainly of two types, namely, anabolism and catabolism.
