Abstracts

Metal denture materials include pure gold and alloys, alloys such as cobalt-chromium alloys, nickel-chromium alloys, and copper alloys. The stainless steel wire commonly used in the production of denture snap rings is one that has been forged. The commonly used materials for making metal dentures are non-precious metal materials such as nickel-on-chromium alloy and alumina, which have the advantage of being strong and durable. However, the biocompatibility is poor and the gums are prone to discoloration. Dentures made of this material are particularly affordable and are now widely used.
