Abstracts

Metal power inductors have high power and high inductance value and some of them possess with high temperature co-efficient stability. An inductor is a passive component consisting of two basic parts: a core and a coil. Core material can be ferrite (which is iron) or metal composite. A coil with no core is also considered an inductor. When the current flowing through an inductor changes, the time-varying magnetic field induces an electromotive force (e.g.) (voltage) in the conductor, described by Faraday's law of induction. According to Lenz's law, the induced voltage has a polarity (direction) which opposes the change in current that created it. As a result, inductors oppose any changes in current through them.
