Abstracts

Metal roof and wall systems are available in a variety of stock sizes and finishes, and can be custom designed to meet requirements from simple functional projects to highly complex iconic projects. Most metal roofs are made of steel. Steel is versatile in existing envelope designs. The roof has the greatest impact on the building's energy use, and the coatings and finishes available today make metal a recognized 'cool roof' product. Cool roofs can help reduce energy consumption by reducing cooling loads. Metal roofs provide the best foundation for photovoltaic installations, as roofs can be expected to last longer than the photovoltaic systems they support. Solar heat recovery systems for walls and roofs can be integrated with steel enclosures and used to meet the needs of air, water or process heating. Cool metal roofs are a great choice for commercial retrofit applications, as they can be effectively installed through sheath ventilation, allowing heat to dissipate through the ridge vents in hot weather, and serve as insulation in cold weather.
