Abstracts

Microelectronic flux is a mixture of anhydrous ethanol, isopropanol, rosin, resin, activator, etc. as the main raw materials through physical stirring. As an important auxiliary material for electronic soldering, flux is mainly used to remove oxides on the surface of solder and components to be soldered, prevent re-oxidation of the surface during soldering, and reduce the surface tension of solder to ensure the smooth progress of the soldering process. The performance of the flux mainly depends on the formulation of the product, that is, the selection and configuration of raw materials such as rosin, resin, and active agent. Microelectronic auxiliary soldering materials are mainly used in the electronic assembly link in the electronic manufacturing process.
