Microservers are small equipment that are used in low power microprocessor chips and places where space is a major constraint. Most of the server motherboard functions are integrated on a single microchip, except DRAM, boot FLASH, and power circuits. A microserver Integrated Circuit (IC) consists of thousands or millions of transistors, resistors, or capacitors. To perform calculations, microserver ICs are used as microprocessors. Transistors in microserver ICs are very small compared to Others ICs and are measured in nanometers. Micro server is a small server appliance that works like a server.
