## Abstracts

Electro-optics are largely used for military applications on different platforms. These systems include both visible and IR sensors and provide situational awareness in both, day and night time. These systems are largely utilized by military forces for imaging, targeting, and surveillance applications and improve situational awareness during day-night, and low-light conditions. Image stabilization and long-range imaging capabilities are two key elements of these systems. These systems are usually installed on military vehicles, aircraft, ships, and UAVs and their usage is primarily focused on target recognition, tracking mobile targets, surveillance, and imaging, even over great distances and in adverse weather conditions. These advanced systems provide the advantage of stabilized panoramic viewing and targeting. The platform remains one of the key application areas of electro-optics as a whole and captures over 40% of the total electro-optical system market.
