Abstracts

In dairy farming a bulk milk cooling tank is a large storage tank for cooling and holding milk at a cold temperature until it can be picked up by a milk hauler. Since milk leaves the udder at approximately 35 °C and retains a natural resistance to bacteria after extraction, milk tanks are used for rapid cooling to a storage temperature of around 4 °C to 6 °C, and prevent further growth of microorganisms.[6] The bulk milk cooling tank is an important milk farm equipment. It is usually made of stainless steel and used every day to store the raw milk on the farm in good condition. It must be cleaned after each milk collection. The milk cooling tank can be the property of the farmer or being rented to the farmer by the dairy plant.
