Abstracts

Ventilation is among the most important functions in a mining operation. Since ventilation directly affects the health and safety of employees working underground, mine owners take the regulation of air flow through a mine very seriously. Factors that determine ventilation design include: the type of mine, its location, the regulations around how much ventilation is required (varies by jurisdiction), and the equipment being used. The latter is especially important because a mine that uses diesel equipment will require more ventilation to dilute the diesel fumes than one that uses electric vehicles.
