Abstracts

Filters used in mining and metallurgical processing generally are engineered with characteristics specific to application in this industry, such as horizontal belt filters, disc filters, and drum filters that are used extensively in mining and metallurgical processing. The market is driven by changing technology and emission guidelines specified across various industries. The industry remains highly motivated toward new product developments, while the entry of nanotechnology has further facilitated the development of filters and membrane. Polymer-based water filtration membranes get clogged up with what they have strained out. With the help of new membrane, biofouling is significantly reduced as organic material and bacteria are destroyed, after they come in contact with the membranes.
