Abstracts

miRNA is a set of small, non-coding RNA molecules that regulate gene expression post transcription. These molecules have an impact on a wide range of biological functions such as cell cycle control, stem cell differentiation, immune modulation, viral replication, and metabolic control. As the aforementioned processes are involved in the pathology of various diseases, tests performed on miRNAs help in disease treatment. Moreover, miRNAs can be easily manipulated than proteins, thus making them more useful for clinical diagnostics and therapeutics applications.
