Abstracts

Application Performance Management (APM) is defined as software that monitors application software to ensure performance and availability. APM is traditionally focused on enterprise applications like ERP systems, alerting IT staff to any disruptions to load time or response time that are preventing end users from accessing mission-critical applications. In addition to just alerting IT managers to problems, APM software also helps to prevent problems from occurring in the first place by detecting early warning signs that might presage future issues.

Mobile application performance management (Mobile APM) software does precisely the same thing, but for mobile applications. Mobile APM has become much more important in recent years with the explosion of mobile apps designed to run on tablets and smartphones which require their own monitoring infrastructure.
