A Signal Booster (also known as cellular repeater or amplifier), in the cell phone industry, is a device used for boosting the cell phone reception to the local area by the usage of a reception antenna, a signal amplifier, and an internal rebroadcast antenna. These are similar to the cellular broadcast towers used for broadcasting by the network providers, but are much smaller, usually intended for use in one building. Modern cellular repeater amplifiers can rebroadcast cellular signals inside a building. The systems usually use an external, directional antenna to collect the best cellular signal, which is then transmitted to an amplifier unit which amplifies the signal, and retransmits it locally, providing significantly improved signal strength. The more advanced models often also allow multiple cell phones to use the same repeater at the same time, so are suitable for commercial as well as home use.

Mobile phone signal boosters are devices that provide strength to a weak signal by amplifying the carrier frequency signal. Due to the presence of numerous dead spots where there is no signal or very poor signal, there is a significant opportunity for the global mobile signal booster market as mobile signal boosters help wireless network providers to improve coverage in such areas and hence improve the quality of service.
