Abstracts

Modular slip systems are independent units built into the framework and are therefore easier to transport than traditional process systems. Device stratification can be realized. Pipelines, storage tanks and necessary process equipment may be designed to be slip resistant to reduce footprint. Clustered process connections are built under off-site controlled conditions to achieve plant acceptance testing (FAT). This reduces the onsite startup time. Modular slip systems are designed for accessibility, including valves, pressure and temperature transmitters, control systems, and pumps customized for specific applications. NO_x reduction for air quality control, gas regulation for gas turbines and boilers, micro gas-liquid plants for trapped natural gas, greatly reducing costs, risks and construction time.
