Abstracts

The Molecular Beam Epitaxy (MBE) system is termed as an ultra-high vacuum technique for the layer-by-layer (epitaxial) deposition of thin films. The technique is exclusively used for the development of very high purity III-V semiconductors where the thickness of layers can be measured with sub-monolayer accuracy. The system contains six solid source effusion cells and 2 RF plasma gas sources. It is exclusively used in the manufacture of semiconductor devices like transistors, and known as a fundamental tool for the development of the nanotechnologies. Moreover, it is a valuable system in the development of urbane optoelectronic and electronic devices and MBE growth of semiconductor layers are essential for resonant-cavity photodetectors.
