Electrosurgery uses high frequency energy to cut and coagulate tissues during surgical procedures. Monopolar electrosurgery devices work on the same principle, where RF energy is used to cut and coagulate the tissues during surgical procedures. However, in monopolar devices, the return current to the electrosurgical generator flows through the patient's body via the return electrodes. Several types of techniques can be used to cut the tissues using monopolar electrosurgery, such as, blended cut, pure cut, desiccation, and spray. The operation of delivering energy originated from the generator to the patient's body is done using electrosurgical pencil which can be single-use or re-usable.
