Abstracts

Magnetic resonance image-guided focused ultrasound system (MRgFUS) is a therapy delivery system used for non-invasive thermal ablation surgery. It is a revolutionary technology that offers high intensity focused ultrasound guided by magnetic resonance imaging technology. This technology offers real-time monitoring, target definition, treatment planning and energy deposition for targeted tissue ablation without damaging surrounding normal tissue. The system is integrated with software that connects the imaging and the therapy system, through which the operator can generate the treatment plan. This surgery is often performed on an outpatient base without administering general anesthesia. In July 2016, the U.S. FDA approved first focused ultrasound devices i.e. ExAblate Neuro, which would be useful to treat essential tremor in patients who do not respond to medication.
