Abstracts

Pesticide residue refers to the general term for pesticide precursors, derivatives, metabolites and impurities that remain in the environment, organisms and food after pesticide use. An instrument that can quickly detect pesticide residues is called a pesticide residue rapid detector. The main cause of pesticide residues in vegetables is that some countries ban organic phosphorus pesticides and carbamate pesticides used in vegetable production, such as methamidophos, omethoate, methamidophos, parathion, methyl parathion Wait. Eating foods containing large amounts of highly toxic and highly toxic pesticide residues can cause acute poisoning accidents in humans and animals. Long-term consumption of agricultural and sideline products with excessive pesticide residues will not cause acute poisoning, but it may cause chronic poisoning of humans and animals, cause disease, and even affect the next generation. Therefore, testing pesticide residues is an indispensable step in the market.
