## Abstracts

Manifolds are used to provide single or multi-station directional control circuits built up from standard NFPA or ISO 4401 directional control valve interfaces. They provide a compact solution and greatly reduce the plumbing and leak joints compared to a system of discrete components. Modular sandwich blocks with additional circuitry can be added, allowing for modifications to be made without disturbing the main plumbing. Many OEM's choose to start with a Bar Manifold in order to test out a concept with modular valves before committing to a final custom solution.
