## Abstracts

A microchannel plate (MCP) is essentially a fast high-gain amplifier for electrons, having many parallel spatial channels for use in imaging applications. It is directly sensitive not only to input electrons, but also to other charged particles (e.g. ions or elementary particles) and to electromagnetic radiation with sufficiently short wavelength (high photon energy), i.e., from the ultraviolet to soft X-rays. The detection efficiency (quantum efficiency) generally depends on the type and energy of the particles or the photons. For obtaining sensitivity to visible or infrared light, one can use a photocathode in front of the MCP.

MCPs are used in various photonic instruments, particularly in image intensifiers and image converters. Besides, they are also applied for the detection of X-rays in medical diagnosis or for industrial inspection. Other application areas are time-of-flight mass spectrometry, nuclear physics, other fundamental physics and electron microscopy.
