Abstracts

Myomectomy a surgical procedure for the removal uterine fibroids. Uterine fibroids are common noncancerous growth in the uterus of women at their child bearing age, causing symptoms such as heavy bleeding during menstrual cycle, increased menstrual cramping, pain in pelvis or lower back, and swelling enlargement of the abdomen. Myomectomy differs from hysterectomy. During myomectomy, the surgeons remove only the fibroids in the uterus while in hysterectomy entire uterus is removed. This procedure preserves the chances of women getting pregnant. There are four types of myomectomy namely; abdominal, hysteroscopic, laparoscopic, and robotic. Results of myomectomy are found to be better and women report improvement in fibroid symptoms, such as heavy menstrual bleeding and pelvic pressure.
