Nanocellulose is a lightweight material obtained from wood pulp or plant cellulose. The term generally refers to cellulose derived nanofibrils that can be long ribbon-like, short rod-shaped or thread-shaped. Nanocellulose is obtained through mechanical or chemical treatment of cellulose, a biopolymer material abundantly available across the globe. Nanocellulose offers immense growth potential owing to its superior mechanical, thermal, rheological, and structural properties vis-?-vis other cellulose-based derivatives and nanomaterials.
