Abstracts

Nanoporous materials comprises of regular organic or inorganic framework that supports a porous structure. The size of these pores is primarily between 100 nanometers and can even be smaller. Nanoporous materials are classified into two broad categories including bulk materials and membranes. Nanoporous membranes include cell membranes while activated carbon and zeolites are examples of bulk nanoporous membranes. Nanoporous materials are manufactured out of natural raw materials; however, artificial nanoporous materials can also be produced. Nanoporous materials with evenly sized pores have the ability of letting only certain substances pass through, while blocking others.
