Abstracts

Near Infrared Medical Imaging is mainly Near-infrared fluorescence (NIRF) imaging, an emerging clinical technology that requires administration of a fluorescence-imaging agent that can be excited at near-infrared (NIR) wavelengths (more than 760nm). Upon illuminating tissue surfaces with penetrating NIR light to excite the imaging agent within the tissues, the generated fluorescence is collected to form a image demarking the tissue deposition of the NIRF imaging agent. This technology has been widely used in various surgeries nowadays, such as Cardiovascular Surgery, Cancer Surgery, Gastrointestinal Surgery and Plastic and Reconstructive Surgery etc.
