Abstracts

Cognitive assessment software is invaluable for understanding the role of specific brain functions across a range of disorders and syndromes. These tools help provide insight into underlying causes, identifying ways to detect the earliest symptoms, and evaluating the effects of interventions designed to improve brain health.

Cognitive assessment tools detect changes in neuropsychological performance and include tests of working memory, learning, and executive function; visual, verbal, and episodic memory; attention, information processing and reaction time; social and emotion recognition; and decision making and response control. These may be stand alone tools or may integrate with EHR software, telemedicine software, and medical practice management software.
