Abstracts

Neurovascular embolectomy device is used during an embolectomy procedure. These devices are used for removal of emboli, obstructing the blood circulation, surgically. Usually, embolectomy is the least preferred option for treatment and other involved therapeutic options are anticoagulation and thrombolysis. Neurovascular device market has undergone a demand-shift with respect to products and techniques. Doctors want to adopt instruments and techniques that offer higher window for stroke treatment with high success rate and minimal post-surgical impact. This is supported by the fact that demand for bare platinum coils is growing at a higher pace in comparison to coated coils. This is mainly due to high costs of coated coils and their less improved clinical outcomes compared to bare platinum coils. Additionally, stroke treatment involves high healthcare expenditure that drives the focus on development of economical treatment techniques.
