Abstracts

Neutron detectors consist of materials that interact with neutrons. Although the principle reaction mechanisms of neutrons with matter are limited, the options for detection media are quite numerous. Detectors can consist of solid, liquid, or gas-filled media. Beside the detection mechanism, there is one major challenge for all types of neutron detectors. They all need to be insensible to gamma ray emission or at least require an implemented technique to discriminate between neutron and background gamma ray events, as neutron detection often takes place in a mixed radiation field.
