Abstracts

Nickel Cadmium (NiCd). Nickel-cadmium cells have an anode made of cadmium hydroxide and a cathode of nickel hydroxide that are immersed in an electrolyte made up of potassium, sodium and lithium hydroxides. Nickel-cadmium batteries require relatively low maintenance, are reliable and have a wide operating temperature range. NiCd batteries are subject to memory effect and may experience thermal runaway if overcharged. Many countries impose strict disposal regulations on NiCd batteries because of the heavy metals used in their manufacture.
