Nitrogen is an important nutrient for all crops in growth and development. Despite of abundance of nitrogen in the environment, only a few plants have the capability to absorb and use the same. Nitrogen provides better texture and color to plants and helps in faster growth which in turn increases the overall agricultural productivity. Nitrogenous fertilizers are inorganic in nature and are mostly used in the agriculture industry. It contains nitrous compounds such as ammonium sulfate, ammonium nitrate, calcium ammonium nitrate and other compounds in small proportions. Fertility of soil determines the concentration of nitrogenous fertilizers which is calculated by soil tests depending on the type of crop.
