Abstracts

NMR spectroscopy provides a route to the understanding of lectin–carbohydrate interactions. NMR is not as powerful as X-ray crystallography in solving the structures of large, multimeric proteins. However, small monomeric proteins are suitable and the described transferred NMR methods offer an imprint of the ligand-binding site. The ideal situation is when a 3D structure of a lectin is available and a combination of transferred NMR and modeling provide a structure of the complex and such projects often provide a saving in materials and time compared to solving the crystal structure of the complex. We hope this broad overview of NMR spectroscopy is of value to the lectin biochemist.
