The principle of the non-contact tonometer is to use a controllable air pulse, and its pressure has the characteristic of linear increase, so that the cornea is flattened to a certain area, and the light reflected from the surface of the cornea is sensed by the monitoring system, and the corneal flattened to a certain area is recorded. time, and convert it into an intraocular pressure value. The advantage is to avoid cross-infection caused by the contact of the tonometer with the cornea, and it can be used for patients who are allergic to corneal surface anesthetics.
